

Abstract of the disclosure

The present invention provides a preventive or a remedy for penile erectile dysfunction, which promotes blood-flow in a penile sponge body over long time and thus induces erection while showing high safety without any adverse effect on a body as a whole, when externally administered to a penis.

Use of a drug of the present invention enables to prevent or treat male penile erectile dysfunction and, at the same time, overcome a problem of female insertion impediment caused by increased resistance due to vaginal secretion disorder. Namely, a sexual life of patients (including aged persons) having coital dysfunction can be normalized and thus QOL can be improved.
